# 1 Safety precautions

Please read this manual carefully and follow all safety precautions before moving, installing, operating and servicing the inverter. If ignored, physical injury or death may occur, or damage may occur to the devices.

If any physical injury or death or damage to the devices occurs for ignoring to the safety precautions in the manual, our company will not be responsible for any damages and we are not legally bound in any manner.

## 1.1 Safety definition

Danger: Serious physical injury or even death may occur if not follow

relevant requirements

Warning: Physical injury or damage to the devices may occur if not follow

relevant requirements

Note: Physical hurt may occur if not follow relevant requirements

Qualified People working on the device should take part in professional electricians: electrical and safety training, receive the certification and be

familiar with all steps and requirements of installing, commissioning, operating and maintaining the device to avoid

any emergency.

## 1.2 Warning symbols

Warnings caution you about conditions which can result in serious injury or death and/or damage to the equipment, and advice on how to avoid the danger. Following warning symbols are used in this manual:

| Symbols                        | Name  | Instruction  | Abbreviation |
|--------------------------------|---|--|--------------|
| Danger                         | Danger Danger Serious physical injury or even death may occur if not follow the relative requirements |  | A            |
| Warning                        | Physical injury or damage to the devices may occur if not follow the relative requirements            |  | $\triangle$  |
| Do not Electrostatic discharge |   | Damage to the PCBA board may occur if not follow the relative requirements | 43           |
| Hot sides                      | Hot sides   | Sides of the device may become hot. Do not touch.                          |              |
| Note Note                      |   | Physical hurt may occur if not follow the relative requirements            | Note         |

## 1.3 Safety guidelines

♦ Only qualified electricians are allowed to operate on the inverter.

Do not carry out any wiring and inspection or changing components when the power supply is applied. Ensure all input power supply is disconnected before wiring and checking and always wait for at least the time designated on the inverter or until the DC bus voltage is less than 36V. Below is the table of the waiting time:

| In       | verter model | Minimum waiting time |
|----------|--------------|----------------------|
| 1PH 220V | 0.4kW-2.2kW  | 5 minutes            |
| 3PH 220V | 4kW-7.5kW    | 5 minutes            |
| 3PH 380V | 0.75kW-37kW  | 5 minutes            |

Do not refit the inverter unauthorized; otherwise fire, electric shock or other injury may occur.

The base of the radiator may become hot during running. Do not touch to avoid hurt.

The electrical parts and components inside the inverter are electrostatic. Take measurements to avoid electrostatic discharge during relevant operation.

## 1.3.1 Delivery and installation

- Please install the inverter on fire-retardant material and keep the inverter away from combustible materials.
- Do not operate on the inverter if there is any damage or components loss to the inverter.
- Do not touch the inverter with wet items or body, otherwise electric shock may occur.

#### Note:

- Select appropriate moving and installing tools to ensure a safe and normal running of the inverter and avoid physical injury or death. For physical safety, the erector should take some mechanical protective measurements, such as wearing safety shoes and working uniforms.
- Do not carry the inverter by its cover. The cover may fall off.
- Ensure to avoid physical shock or vibration during delivery and installation.
- Install away from children and other public places.
- The inverter cannot meet the requirements of low voltage protection in IEC61800-5-1 if the altitude of installation site is above 2000m.
- The leakage current of the inverter may be above 3.5mA during operation. Ground with proper techniques and ensure the grounding resistor is less than 10Ω. The conductivity of PE grounding conductor is the same as that of the phase conductor (with the same cross sectional area).

(+) and (-) are DC power supply input terminals. R, S and T (L,N) are AC power supply input terminals. U, V and W are output terminals. Please connect the input power cables and motor cables with proper techniques; otherwise the damage to the inverter may occur.

## 1.3.2 Commissioning and running

- Disconnect all power supplies applied to the inverter before the terminal wiring and wait for at least the designated time after disconnecting the power supply.
- High voltage is present inside the inverter during running. Do not carry out any operation except for the keypad setting.
- The inverter cannot be used as "Emergency-stop device".
  If the inverter is used to break the motor suddenly, a mechanical braking device should be provided.

#### Note:

- Do not switch on or off the input power supply of the inverter frequently.
- For inverters that have been stored for a long time, check and fix the capacitance and try to run it again before utilization.
- Cover the front board before running, otherwise electric shock may occur.

## 1.3.3 Maintenance and replacement of components

- Only qualified electricians are allowed to perform the maintenance, inspection, and components replacement of the inverter.
- Disconnect all power supplies to the inverter before the terminal wiring. Wait for at least the time designated on the inverter after disconnection.
- Take measures to avoid screws, cables and other conductive matters to fall into the inverter during maintenance and component replacement.

#### Note:

- Please select proper torque to tighten screws.
- Keep the inverter, parts and components away from combustible materials during maintenance and component replacement.
- Do not carry out any isolation and pressure test on the inverter and do not measure the control circuit of the inverter by megameter.

# 1.3.4 What to do after scrapping

There are heavy metals in the inverter. Deal with it as industrial effluent.

## 2 Product overview

## 2.1 Unpacking inspection

Check as follows after receiving products:

- Check that there are no damage and humidification to the package. If not, please contact with local agents or offices.
- Check the information on the type designation label on the outside of the package to verify that the drive is of the correct type. If not, please contact with local dealers or offices.
- 3. Check that there are no signs of water in the package and no signs of damage or breach to the inverter. If not, please contact with local dealers or offices.
- 4. Check the information on the type designation label on the outside of the package to verify that the name plate is of the correct type. If not, please contact with local dealers or offices.
- 5. Check to ensure the accessories (including user's manual and control keypad) inside the device is complete. If not, please contact with local dealers or offices.

# 2.2 Name plate

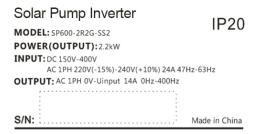

Figure 2-1 Name plate

**Note:** This is the example of SP600 inverter standard products and the CE\TUV\IP20 certifications are marked according to the reality.

## 2.3 Type designation key

The type designation contains information on the inverter. The user can find the type designation on the type designation label attached to the inverter or the simple name plate.

| Key                  | Sign | Description                | Remarks  |
|----------------------|------|----------------------------|--|
| Product abbreviation | 1)   | Product abbreviation       | SP600 Series.  |

# 3 Installation guidelines

The chapter describes the mechanical installation and electric installation.

- Ensure the power supply of the inverter is disconnected during the operation. Wait for at least the time designated after the disconnection if the power supply is applied.
- The installation and design of the inverter should be complied with the requirement of the local laws and regulations in the installation site. If the installation infringes the requirement, our company will exempt from any responsibility. Additionally, if users do not comply with the suggestion, some damage beyond the assured maintenance range may occur.

## 3.1 Mechanical installation

#### 3.1.1 Installation environment

The installation environment is the safeguard for a full performance and long-term stable functions of the inverter. Charlette installation environment or follows:

| functions of the inverter. Check the installation environment as follows: |  |  |
|---|--|--|
| Environment   | Conditions   |  |
| Installation site   | Indoor   |  |
| Environment<br>temperature  | The ambient temperature of inverter is -10 °C ~50 °C while air temperature change should be less than 0.5 °C per minute. The inverter will be derated once ambient temperature exceeds 40 °C. It is not recommended to use the inverter if ambient temperature is above 50 °C. To ensure reliability, do not use the inverter if the ambient temperature changes frequently. Provide cooling fan or air conditioner to control the internal ambient temperature below the required one if the inverter is used in a close space such as in the control cabinet. When the temperature is too low, if the inverter needs to restart to run after a long stop, it is necessary to provide an external heating device to increase the internal temperature, otherwise damage to the devices may occur. |  |
| Humidity  | RH≤90%. No condensation is allowed.  |  |
| Storage temperature   | -40°C~+70°C. The temperature change rate is less than 1°C/minute.  |  |

| Environment                         | Conditions  |  |  |
|-------------------------------------|---|--|--|
| Running<br>environment<br>condition | The installation site of the inverter should: keep away from the electromagnetic radiation source; keep away from contaminative air, such as corrosive gas, oil mist and flammable gas; ensure foreign objects, such as metal power, dust, oil, water cannot enter into the inverter(do not install the inverter on the flammable materials such as wood); keep away from direct sunlight, oil mist, steam and vibration environment. |  |  |
| Altitude                            | Below 1000m  If the altitude is above 1000m, please derate 1% for every additional 100m.  |  |  |
| Vibration                           | $\leq 5.8 \text{m/s}^2 (0.6 \text{g})$  |  |  |
| Installation direction              | The inverter should be installed on an upright position to ensure sufficient cooling effect.  |  |  |

#### Note:

- SP600 series inverters should be installed in a clean and ventilated environment according to enclosure classification.
- Cooling air must be clean, free from corrosive materials and electrically conductive dust.

#### 3.1.2 Installation direction

The inverter may be installed on the wall or in a cabinet.

The inverter needs be installed in the vertical position. Check the installation site according to the requirements below. See *Appendix D Dimension drawings* for frame details.

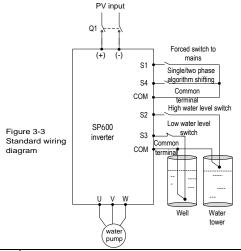

#### 3.1.3 Installation manner

- (1) 1) Mark the locations of installation holes. For details about the holes, see the inverter dimension diagram in the appendix D.
- 2) Fix the screws or bolts into the marked locations.
- 3) Lean the inverter against the wall.
- 4) Fasten the tightening screws on the wall.

## 3.2 Standard wiring

#### 3.2.1 Terminals of main circuit

The figure below shows the standard wiring of inverter.

- ♦ The DC breaker Q1 must be installed as the protection switch for PV input.
- ♦ In parallel connection, the combination box special for PV must be used.
- When the distance between the PV input component and inverter exceeds 10 meters, type-II surge protection devices must be configured at the DC side.

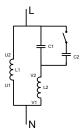

- When the distance between the pump and inverter exceeds 50 meters, it is recommended to configure output reactors. See appendix A.4 for the output reactor model selection.
- The inverter automatically runs after being powered on. If parameters need to be set, follow the parameter setting instructions in chapter 5.
- Before connecting the braking resistor cable, remove the yellow labels of PB, (+), and (-) from the terminal blocks. Otherwise, poor connection may occur.

| Termina | ls of | main | circuit |  |
|---------|-------|------|---------|--|

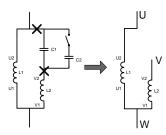

| Terminal          | Name                | Function   |  |
|-------------------|---------------------|--|--|
| R, S, T<br>(L, N) | AC input            | 3PH (1PH) AC input terminals, connected to the grid  Note: Use the screws equipped with the inverter for wiring. |  |
| (+), (-)          | PV input            | Solar cell panel input terminals   |  |
| U, V, W           | Inverter<br>output  | 3PH/1PH AC output terminals, connected to the pump motor  Note: 1PH motors must connect to terminals U and W.    |  |
| <b>(±)</b>        | Safety<br>grounding | Safety protection grounding terminal. Each inverter must be grounded   |  |

## Description for -SS2 single-phase output models

- 1) Generally, the output terminals U and W of the inverter connect to the phase cables of the single-phase motor.
- 2) If the single-phase pump cannot be started, the two-phase control method must be used, and the start-up and running capacitors (if any) of the motor must be removed. The figure below shows the internal wiring of the common single-phase motor. In the figure, L1, L2, C1, and C2 indicate the running winding, start-up winding, running capacitor, and start-up capacitor. When the motor speed exceeds 75% of the rated speed, the start-up capacitor is switched off.

Internal wiring of the single-phase motor winding after removing the starting and running capacitor:

U1 and V1 are the common terminals of the windings. Connect them to the output terminal W of the solar pumping inverter. Connect U2 to the output terminal U of the inverter. Connect V2 to the output terminal V of the inverter. (Note: Use the screws equipped with the inverter.) Connect S4 of the inverter to COM in short circuited manner.

#### 3.2.2 Terminals of control circuit

Functions of control terminals

| Category      | Terminal<br>symbol | Terminal name              | Terminal function  |  |
|---------------|--------------------|----------------------------|--|--|
|               | 24V                | 24V power supply           | It provides the power of   |  |
| Power supply  | сом                | Common terminal            | 24V±10% and maximum current of 200mA.  It functions as the working power supply of digital input and output or externally connects to the sensor power supply. |  |

# 4 Keypad operation procedure

# 4.1 Keypad introduction

Keypads are used to control SP600 series inverters, read the state data and adjust parameters. If external keypads are needed, select keypad extension wires.

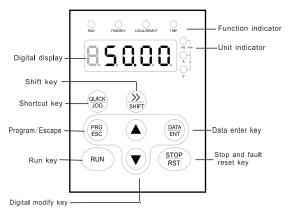

Figure 4-2 Keypad diagram for inverters

**Note:** The keypads of inverters can be used as external keypads.

# 4.2 Keypad displaying

The keypad displaying state of SP600 series inverters is divided into stopping state parameter, running state parameter, function code parameter editing state and fault alarm state and so on.

## 4.2.1 Displayed state of stopping parameters

When the inverter is in the stopping state, the keypad will display stopping parameters as shown RRRRR

In the stopping state, various kinds of parameters can be displayed. Select the parameters to be displayed or not by P07.07. See the instructions of P07.07 for the detailed definition of each bit.

In the stopping state, there are 4 parameters that can be displayed. They are: set frequency, bus voltage, input terminals state, and output terminals state.

<u>/SHIFTI</u> can shift the parameters from left to right. QUICK/JOG(P07.02=2) can shift the parameters from right to left.

## 4.2.2 Displayed state of running parameters

After the inverter receives valid running commands, the inverter will enter into the running state and the keypad will display the running parameters. RUNTUNE LED on the keypad is on, while the FWD/REV is determined by the current running direction which is as shown in figure 4-2.

In the running state, there are 6 parameters that can be displayed. They are: running frequency, set frequency, bus voltage, output voltage, output current, and rotating speed. 
SHIFT can shift the parameters from left to right. QUICK/JOG (P07.02=2) can shift the parameters from right to left.

# 4.2.3 Displayed state of faults

If the inverter detects the fault signal, it will enter into the fault pre-alarm displaying state. The keypad will display the fault code by flicking. The TRIP LED on the keypad is on, and the fault reset can be operated by the STOP/RST on the keypad, control terminals or communication commands.

## 4.2.4 Displayed state of function codes editing

In the state of stopping, running or fault, press PRG/ESQ to enter into the editing state (if there is a password, see P07.00). The editing state is displayed on two classes of menu, and the order is: function code group/function code number → function code parameter, press DATA/ENT into the displayed state of function parameter. On this state, press DATA/ENT to save the parameters or press PRG/ESQ to escape.

Figure 4-2 Displayed state

# 4.3 Keypad operation

Operate the inverter via operation panel. See the detailed structure description of function codes in the brief diagram of function codes.

## 4.3.1 How to modify the function codes of the inverter

The inverter has three levels menu, which are:

- 1. Group number of function code (first-level menu)
- 2. Tab of function code (second-level menu)
- 3. Set value of function code (third-level menu)

Remarks: Press both the PRG/ESC and the DATA/ENT can return to the second-level menu from the third-level menu. The difference is: pressing DATA/ENT will save the set parameters into the control panel, and then return to the second-level menu with shifting to the next function code automatically; while pressing PRG/ESC will directly return to the second-level menu without saving the parameters, and keep staying at the current function code.

Under the third-level menu, if the parameter has no flickering bit, it means the function code cannot be modified. The possible reasons could be:

- This function code is not modifiable parameter, such as actual detected parameter, operation records and so on;
- 2) This function code is not modifiable in running state, but modifiable in stop state.

Example: Set function code P00.01 from 0 to 1.

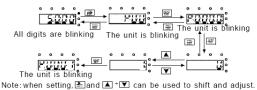

Figure 4-3 Sketch map of modifying parameters

## 4.3.2 How to set the password of the inverter

SP600 series inverters provide password protection function to users. Set P07.00 to gain the password and the password protection becomes valid instantly after quitting from the function code editing state. Press PRG/ESC again to the function code editing state,

"0.0.0.0.0" will be displayed. Unless using the correct password, the operators cannot enter it. Set P07.00 to 0 to cancel password protection function.

The password protection becomes effective instantly after retreating from the function code editing state. Press <a href="PRG/ESC">PRG/ESC</a> again to the function code editing state, "0.0.0.0.0" will be displayed. Unless using the correct password, the operators cannot enter it.

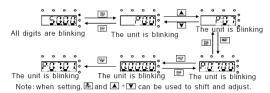

Figure 4-4 Sketch map of password setting

#### 4.3.3 How to watch the inverter state through function codes

SP600 series inverters provide group P17 as the state inspection group. Users can enter into P17 directly to watch the state.

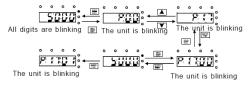

Figure 4-5 Sketch map of state watching

# 5 Commissioning guidelines

- Disconnect all power supplies applied to the inverter before the terminal wiring and wait for at least the designated time after disconnecting the power supply.
- High voltage is present inside the inverter during running. Do not carry out any operation except for the keypad setting.
- The inverter automatically runs once power on. If parameters need to be set, follow the guidelines in this chapter.

## 5.1 Inspection before operation

Before powering on the inverter, ensure that:

- a) The inverter is grounded reliably.
- b) The wiring is correct and reliable.
- c) The AC/DC breaker is selected correctly.
- d) The PV input voltage is in the allowed range of the inverter.
- e) The type, voltage, and power of the motor match those of the inverter.

## 5.2 Trial run

Close the DC breaker. The inverter automatically runs with a delay of 10 seconds. Check the water yield of the pump. If the water yield is normal, the trial run is successful. If the water yield is under the normal value, exchange any two motor cables, connect the cables, and perform trial run again.

# 5.3 Parameter settings

The inverter automatically runs by default once being powered on. If you want to set parameters, press QUICK/JOG within 10 seconds since the inverter power-on to switch to the keypad control mode (COCAL/REMOT) is off) and then set parameters. If the running indicator is already on after the inverter is powered on, press STOP/RST to enter the parameter setting mode. After parameter setting, turn off and then turn on the power switch. The inverter runs again.

# 5.4 Advanced settings

**Note:** The default settings of the inverter for the water pump can apply to most conditions and the advanced settings are not required in most cases.

## 5.4.1 PI adjustment to the water yield

If the user requires large or low water yield, it is necessary to adjust PI (P15.06~P15.10)

properly. The bigger PI parameters, the stronger the effect is, but the frequency fluctuation of the motor is bigger. In reserve, the lower the water yield is, the more stable the motor frequency is.

## 5.4.2 Special settings for single phase motors

- a) When the single phase motor is in bad running performance, the user can adjust P04 VF curve settings: set P04.00=1 and set P04.03~P04.08 to appropriate values according to commissioning conditions; increase the voltage if the motor cannot start and decrease the voltage if the current is high.
- b) When the light is normal and the system starts slowly, increase P15.28 initial voltage differential value appropriately.
- c) For single phase motors with two-phase control (capacitor-removing):
- ① The maximum voltage needs to be less than 1/1.6 of the bus voltage. It is recommended to set the rated voltage P02.04 less than 200V, or limit the maximum voltage output by multi-dot V/F curve.
- ② Observe the currents of the windings through P17.38 and P17.39, the switched current is the combination current of the two windings. The impedances of the windings are different, so the currents are different at the same voltage output.
- ③ P04.35 can be used to change the output currents of the main and secondary windings. It is recommended that qualified engineers perform adjustment since the voltage adjustment is associated with motor design parameters. Otherwise, the motor performance may be impacted.

# 6 Function parameters

- "O": means the set value of the parameter can be modified on stop and running state;
- "O": means the set value of the parameter cannot be modified on the running state;
- "• ": means the value of the parameter is the real detection value which cannot be modified;

**Note:** The inverter implements auto checking and restriction on the parameter modification property. This prevents users from modifying parameters by misoperation.

# 6.1 Common function parameters for solar pumping inverter control

| Function code | Name                  | Detailed illustration of parameters        | Default | Modify |
|---------------|-----------------------|--|---------|--------|
| P00 Group     | Basic function gro    | up   |         |        |
|               |                       | 0: SVC 0                                   |         |        |
|               |                       | No need to install encoders. Suitable in   |         |        |
|               |                       | applications which need low frequency,     |         |        |
|               |                       | big torque for high accuracy of rotating   |         |        |
|               |                       | speed and torque control. Relative to      |         |        |
|               |                       | mode 1, it is more suitable for the        |         |        |
|               | Speed control<br>mode | applications which need small power.       |         |        |
|               |                       | 1: SVC 1                                   |         |        |
| P00.00        |                       | 1 is suitable in high performance cases    | 2       | 0      |
|               |                       | with the advantage of high accuracy of     |         |        |
|               |                       | rotating speed and torque. It does not     |         |        |
|               |                       | need to install pulse encoder.             |         |        |
|               |                       | 2: SVPWM control                           |         |        |
|               |                       | 2 is suitable in applications which do not |         |        |
|               |                       | need high control accuracy, such as the    |         |        |
|               |                       | load of fan and pump, and suitable when    |         |        |
|               |                       | one inverter drives multiple motors.       |         |        |

| Function code | Name                                 | Detailed illustration of parameters   | Default           | Modify |
|---------------|--------------------------------------|---|-------------------|--------|
| P00.04        | Upper limit of the running frequency | The upper limit of the running frequency is the upper limit of the output frequency of the inverter which is lower than or equal to the maximum frequency.  Setting range: P00.05~P00.03 (Max. output frequency)  | 50.00Hz           | 0      |
| P00.05        | Lower limit of the running frequency | The lower limit of the running frequency is that of the output frequency of the inverter. The inverter runs at the lower limit frequency if the set frequency is lower than the lower limit.  Note: Max. output frequency ≥ Upper limit frequency ≥ Lower limit frequency Setting range: 0.00Hz~P00.04 (Upper limit of the running frequency) | 0.00Hz            | ©      |
| P00.11        | ACC time 1                           | ACC time means the time needed if the inverter speeds up from 0Hz to the Max. output frequency (P00.03).  DEC time means the time needed if the   | Depend<br>on mode | 0      |
| P00.12        | DEC time 1                           | inverter speeds down from the Max. Output frequency to 0Hz (P00.03). SP600 series inverters have four groups of ACC/DEC time which can be selected by P05. The factory default ACC/DEC time of the inverter is the first group. Setting range of P00.11 and P00.12: 0.0~3600.0s   | Depend<br>on mode | 0      |

|---------------|-----------------------------------|--|---------|--------|
| P15.13        | Empty-water level threshold       | 0.0~100.0% This code is valid when P15.11 water level control is based on analog input. If the detected water level control analog signal is greater than the water level threshold P15.13 and keeps in the state after the delay time P15.16, the system reports A- tL and sleeps. If the delay time is not reached (that means non-continuous), the delay time is automatically cleared. When the detected water level control analog signal is less than the water level threshold, the delay counts.  During the empty-water alarm, if the detected water level control analog signal is less than the water level threshold P15.13 and delay counts, the empty-water alarm is cleared after the delay time set by P15.17 in this continous state. In the non-continuous state, the delay time is automatically cleared. | 75.0%   | 0      |

| P19.06        | Bus reference<br>voltage  | This function code is set to the bus reference voltage at PV input when the system contains the boost module. By default, this function code is set to 350V for models of 220V and 570V for models of 380V.  Setting range: 300.0V~600.0V                             | 350.0V  | ©      |
| P19.07        | Boost voltage loop<br>KP1 | If the difference between the bus reference voltage and actual bus voltage is greater than 20V, the boost voltage loop uses this group PI parameter.  Otherwise, the boost voltage loop uses the first group PI parameter.  Setting range: 0.000~65.535               | 0.500   | 0      |
| P19.08        | Boost voltage loop<br>KI1 | If the difference between the bus reference voltage and actual bus voltage is greater than 20V, the boost voltage loop uses the PI parameters of this group. Otherwise, the boost voltage loop uses the PI parameters of the first group. Setting range: 0.000~65.535 | 0.080   | 0      |
| P19.10        | Boost software version    | Once being powered, the boost module sends its version information to the converter module.   | 0.00    | •      |

#### Note:

 The time when the pump inverter operated to the lower limit of PI output frequency after inverter start-up is determined by the ACC time. Delay time counting follows the rules if multiple fault conditions are met simutaneously: For example, if all fault conditions of weak light, full water, and underload are met at the same time, the inverter will count the delay time for each fault independently. If the delay time of a fault is reached, the fault is reported. The delay time counting of the other two faults keeps. If the reported fault is resolved but the conditions of the other two faults persist, the delay time counting of the other two faults continues. If a fault condition is not met during counting, the delay time of this fault is cleared.

## 7 Fault diagnosis and solution

Do as follows after the inverter encounters a fault:

- Check to ensure there is nothing wrong with the keypad. If not, please contact with the local
  office.
- 2. If there is nothing wrong, please check P07 and ensure the corresponding recorded fault parameters to confirm the real state when the current fault occurs by all parameters.
- 3. See the following table for detailed solution and check the corresponding abnormal state.
- 4. Eliminate the fault and ask for relative help.
- 5. Check to eliminate the fault and carry out fault reset to run the inverter.

| Fault code | Fault type                              | Possible cause  | Solutions  |   |
|------------|---|---|--|---|
| OUt1       | IGBT U                                  | The acceleration is too fast.   |  |   |
| OUt2       | IGBT V                                  | This phase IGBT is     damaged internally   | Increase the acceleration  |   |

| OH2        | IGBT overheat           | Ambient temperature is too high.     The time of overload running is too long.   | change the fan.  2. Decrease the environment temperature.   |  |  |
| EF         | External fault          | SI external fault input terminals action   | Check the external device input.  |  |  |
| CE         | Communication<br>error  | 1. The baud rate setting is incorrect. 2. Fault occurs to the communication wiring. 3. The communication address is wrong. 4. There is strong interference to the communication.   | Set proper baud rate.     Check the communication connection distribution     Set proper communication address.     Change or replace the connection distribution or improve the anti-interference capability.                                      |  |  |
| ItE        | Current detection fault | The connection of the control board is not good.     Assistant power is bad     Hall components is broken     The magnifying circuit is abnormal.  | 1. Check the connector and repatch. 2. Change the Hall. 3. Change the main control panel.   |  |  |
| tE         | Autotuning fault        | The motor capacity does not comply with the inverter capability.     The rated parameter of the motor is not set correctly.     The offset between the parameters from autotune and the standard parameter is huge     Autotune overtime | 1. Change the inverter mode. 2. Set the rated parameter according to the motor name plate. 3. Empty the motor load. 4. Check the motor connection and set the parameter. 5. Check if the upper limit frequency is above 2/3 of the rated frequency. |  |  |
| EEP        | EEPROM fault            | Error of controlling the write and read of the parameters     Damage to EEPROM   | Press STOP/RST to reset.     Change the main control panel.   |  |  |
| PIDE       | PID feedback fault      | PID feedback is offline.   | Check the PID feedback signal   |  |  |

| Fault code | Fault type                      | Possible cause  | Solutions  |  |  |
|------------|---------------------------------|---|--|--|--|
|            |                                 | The PID feedback source disappears.   | Check the PID feedback source.   |  |  |
| END        | Time arrival of factory setting | The actual running time of the inverter is above the internal setting running time.   | Ask for the supplier and adjust the setting running time.  |  |  |
| OL3        | Electrical overload             | The inverter will report overload pre-alarm according to the set value.   | Check the load and the overload pre-alarm point.   |  |  |
| ETH1       | Grounding short circuit fault 1 | The grounding of the inverter output terminal is short  | Check whether the motor wiring   |  |  |
| ETH2       | Grounding short circuit fault 2 | circuited. The current detection circuit is faulty. The actual motor power sharply differs from the inverter power.   | is proper.  Change the Hall.  Change the main control panel.  Set motor parameters correctly.  |  |  |
| dEu        | Velocity deviation fault        | The load is too heavy or stalled.   | Check the load and ensure it is normal. Increase the detection time.     Check whether the control parameters are normal.                              |  |  |
| STo        | Maladjustment fault             | The control parameters of the synchronous motors not set properly.     The autotuning parameter is not correct.     The inverter is not connected to the motor. | Check the load and ensure it is normal.     Check whether the control parameter is set properly or not.     Increase the maladjustment detection time. |  |  |
| LL         | Electronic underload fault      | The inverter will report the underload pre-alarm according to the set value.  | Check the load and the underload pre-alarm point.  |  |  |
| tSF        | Hydraulic probe damage          | Hydraulic probe damage  | Change the damaged hydraulic probe.  |  |  |

| Fault code | Fault type  | Possible cause   | Solutions  |
|------------|---|--|--|
| PINV       | PV reverse connection fault                             | Incorrect PV wiring  | Change the wiring direction of the positive and negative terminals and connect the cables again.   |
| PVOC       | PV overcurrent  | 1. The acceleration or deceleration is too fast. 2. The inverter power is too low. 3. The load transients or is abnormal. 4. The grounding is short circuited. | Increase the ACC or DCC time.     Select the inverter with a larger power.     Check if the load is short circuited (the grounding short circuited or the wire short circuited) or the rotation is not smooth. |
| PVOV       | PV overvoltage  | The solar cell panel input voltage is too high.     Model -4 is set as another model.  | Reduce the number of solar cell panels that are wired in series.      Check and reset the model.   |
| PVLV       | PV undervoltage   | The power of the solar cell panel series is too low or it is cloudy and rainy weather.     The motor start-up current is too high.                             | Increase the number of solar cell panels or perform the test in the normal sun light.     Change the motor.  |
| E-422      | Fault on communication with boost module 422            | Improper contact with the communication cables   | Check the four communication cables of 422 and ensure that they are connected properly.  |
| OV         | Bus overvoltage<br>detected at the<br>boost module side | The sun light changes suddenly.  | Adjust the boost PI parameters.<br>Enlarge the values of P19.07<br>and P19.08.   |
| A-LS       | Weak light alarm  | The sun light is weak or the solar cell panel configuration is insufficient.   | The equipment automatically runs when the light becomes strong.  Check whether the solar cell  |

|            |                     |                         | incorrectly.  |  |  |

## Appendix A Options and use

### A.1 GPRS module and monitoring APP

The pumping inverters support the installation of the GPRS module to implement remote monitoring. The GPRS module connects to the inverters through 485 communication. The inverter operation state can be monitored on the APP in the mobile phone or web page in real time.

Method for connecting the GPRS to the inverter:

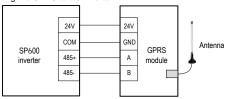

Figure A-1 Connecting the GPRS module to the inverter

For more information, see the GPRS/GPS adaptor operation guide matching the GPRS module or contact the our local office. When consulting, provide the product models and serial numbers.

#### A.2 Cables

#### A.2.1 Power cables

Dimension the input power and motor cables according to local regulations.

**Note:** A separate PE conductor is required if the conductivity of the cable shield is not sufficient for the purpose.

#### A.2.2 Control cables

The relay cable needs the cable type with braided metallic screen.

Keypads need to be connected with network cables. The network cables must be shielded in complicated electromagnetic environments.

Communication cables must be shielded twisted pairs.

#### Note:

- Run analog and digital signals in separate cables.
- Check the insulation of the input power cable according to local regulations before connecting to the drive.

### Recommended power cables for standard inverter models

|                | Recommend ca            | able size(mm) | Terminal | Tightening |  |

| SP600-037G-4   | 35                      | 16            | M6       | 4~6        |  |

#### Note:

For the cable selection for model IP54, see the cables applicable to the models with the same power as model IP54 in this table.

It is appropriate to use the recommended cable size under 40°C and rated current. The wiring distance should be no more than 100m.

If the control cable and power cable must cross, the angle between them must be 90°.

If the inside of the inverter is moist, the insulation resistance will decrease. If there is moisture in the inverter, dry up the inverter and measure the humidity again.

# Appendix B Recommended solar modules

B.1 Recommended configuration for solar pumping inverters

## Appendix C Inverter mains & PV switching solution

#### C.1 Solution introduction

Generally, inverters do not allow simultaneous connection to mains and PV. If such simultaneous connection is required, switching control circuit must be configured externally.

The figure below shows the solution for reference.

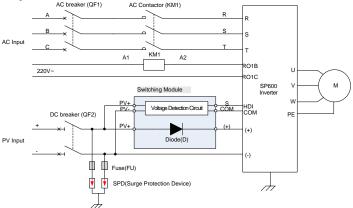

Figure C-1 Inverter mains & PV switching solution

### C.2 Wiring terminals

The following figures show the wiring terminals of different models for IP54 inverters.

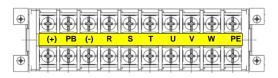

Figure C-2 Wiring terminals of 4-5.5kW models

Figure C-3 Wiring terminals of 7.5-37KW models

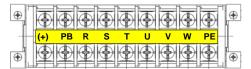

Figure C-4 Wiring terminals of of -4 models for inverters ≤2.2kW

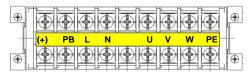

Figure C-5 Wiring terminals of -S2/-SS2 models for inverters  $\leq$ 2.2kW

# Wiring terminal functions

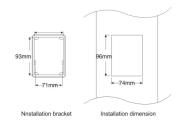

| Terminal | Name                | Function   |  |  |  |  |
|----------|---------------------|--|--|--|--|--|
| R, S, T  | AC input            | 3PH 380/220V AC input terminals, connected to the grid   |  |  |  |  |
| L, N     | AC input            | 1PH 220V AC input terminals, connected to the grid   |  |  |  |  |
| (+), (-) | PV input            | Solar cell panel input terminals   |  |  |  |  |
| U, V, W  | Inverter output     | 3PH/1PH AC output terminals, connected to pump motor  Note: 1PH motors must connect to terminals U and W.      |  |  |  |  |
| <b>(</b> | Safety<br>grounding | Safety grounding terminal. Each inverter must be grounded properly.  Note: It is at the bottom of the chassis. |  |  |  |  |

## **Appendix D Dimension drawings**

### D.1 External keypad structure

If the keypad is externally installed on an optional bracket, it can be 20 meters away from the inverter at most

### D.2 Dimensions of 0.75-110kw models

| Inverter Model | W1  | W2  | H1  | H2  | D1  | Installation hole(d) |
|----------------|-----|-----|-----|-----|-----|----------------------|
| SP600-0R4G-SS2 | 120 | 110 | 180 | 170 | 154 | 4                    |

## Appendix E Further information

## E.1 Product and service inquiries

Address any inquiries about the product to your our local offices, quoting the type designation and serial number of the unit in question.

#### E.2 Feedback of Inverters manuals

Your comments on our manuals are welcome. Please visit our website and select Online Feedback to contact us.

### E.3 Document library on the Internet

You can find manuals and other product documents in PDF format on the Internet. Go to <u>our</u> website and select PDF user manual download.
